

Industrializing Data Science

Scaling POCs via Reference Blueprints & Modular Architecture

CLOSING THE "BLUEPRINT GAP"

Mental Blueprint

Conceptual ideas and "rough drafts" held in technical minds.

- ✗ Every project starts from scratch.
- ✗ Requires bespoke coding & testing.
- ✗ Scaling is slow and labor-intensive.

Actual Blueprint

Productized code written as a **parameterized skeleton**.

- ✓ Rapidly deployable with parameters.
- ✓ Decouples engineering from use cases.
- ✓ Scales across the bank instantly.

STRATEGY: PROACTIVE ARSENAL

The Arsenal

Proactively building technical skeletons (Engines) before specific POCs are even assigned.

The Attachment

Leadership secures use cases; Tech "attaches" them to the ready-to-use blueprints.

The Velocity

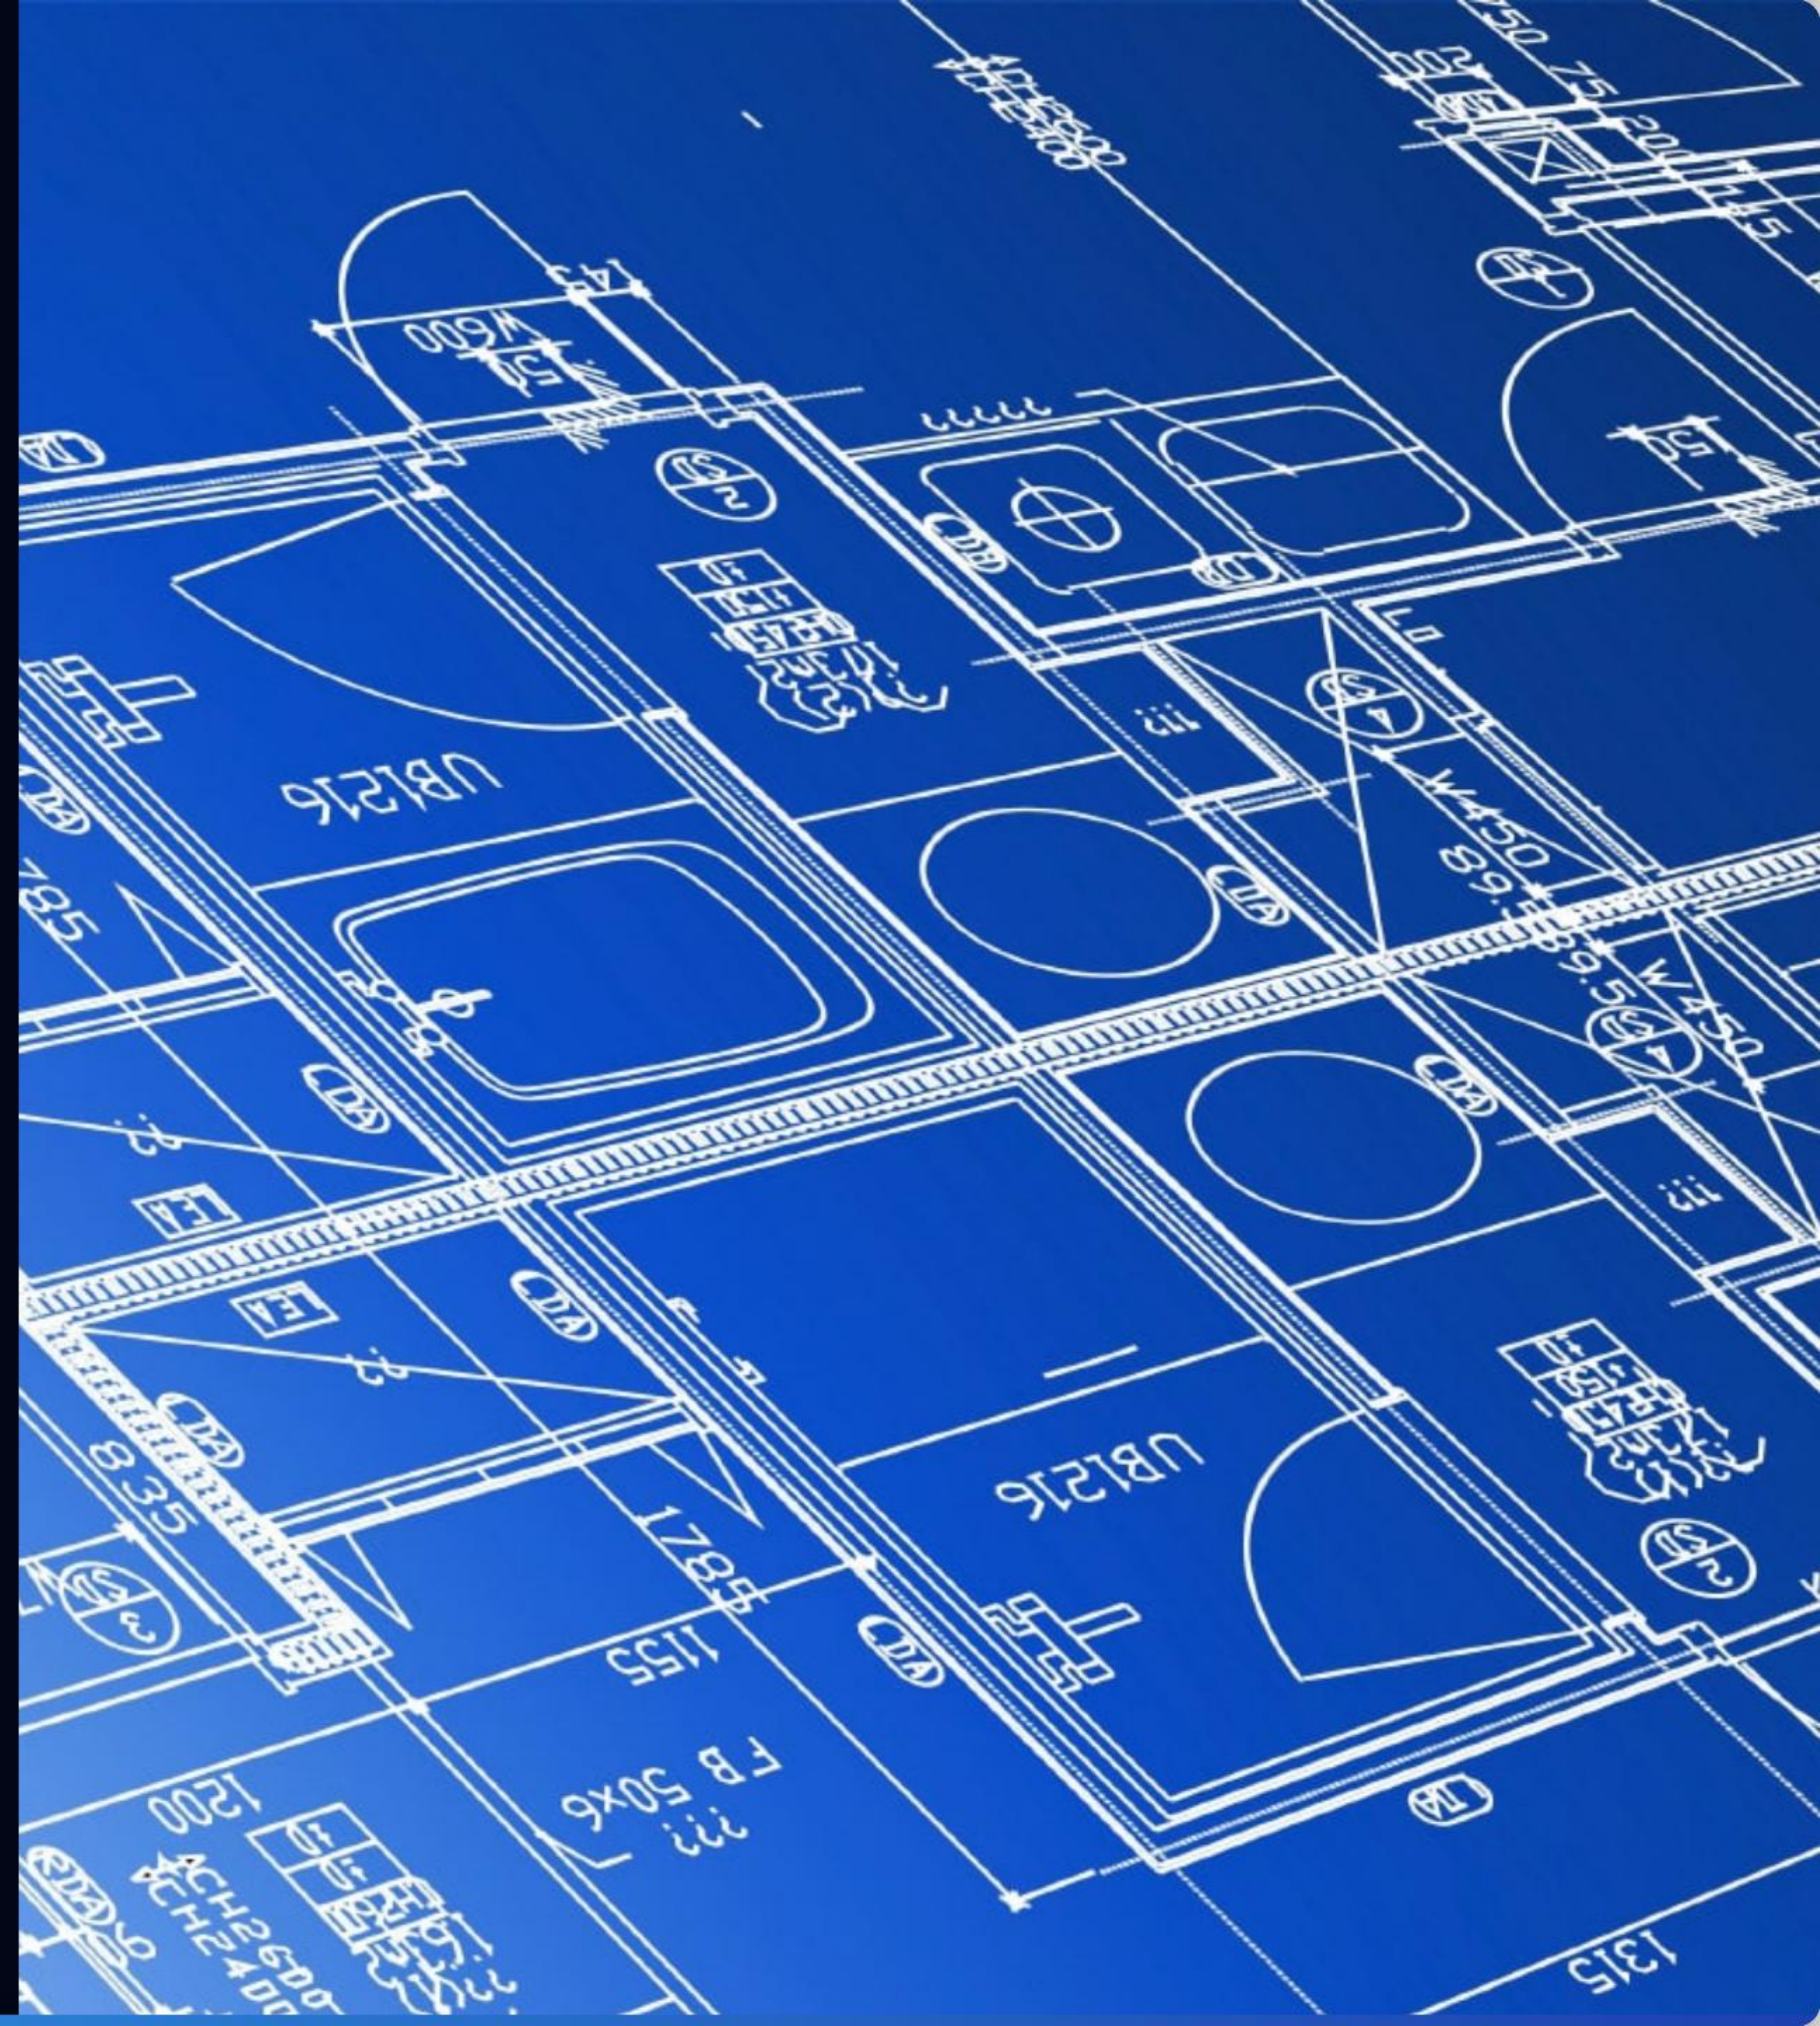

Reduced time-to-market by focusing on **Configuration** rather than **Coding**.

INDUSTRIALIZATION

Building Skeletons is not "Extra Work."

It is the only way to avoid technical debt and bespoke stagnation. By spending 10% more time upfront on the skeleton, we save 80% effort on every subsequent deployment.

The Goal: Every new project adds a permanent, reusable tool to our Bank-wide library.

CASE: AI OUTPUT QUALITY ENGINE

-  **Genesis:** Transcript Summary Quality evaluation.
-  **Industrialization:** Built as a universal skeleton for any AI output.
-  **Parameter Driven:** Switch from "Transcript" to "Chat" or "Code" by changing config parameters.
-  **Micro-service:** Now a bank-wide service for AI Output Validation.

| THE OPERATIONAL SHIFT

Leadership

Secures high-value use cases
and bank-wide demand.

Tech (VP Lead)

Constructs and manages the
library of scalable skeletons.

Unified Result

A "Micro-service Factory" that
scales data products bank-
wide.

Next Steps?

Transitioning from Bespoke to Industrialized Data Science
